

## INNOVATIVE FORKLIFT ACCESSORIES FROM BOLO

### **BOLO SLIMVIEW MIRROR SYSTEM**

BOLO is a World patented dual mirror system that relies on the interface of an outer convex lens reflecting imagery forward onto a flat mirror that is viewed by the driver. The mirrors/lenses are secured in an adjustable housing unit that maintains a fixed distance between the two, with 90% of the mirror assembly moulded from recycled plastic.

- BOLO SlimView focuses on the tines and provides a compressed view around the carried load. Designed for small forklifts (from 1 tonne up to 3.5 tonnes), the mirror assembly fits compactly to the mast and provides sufficient space between the cabin and the carriage to avoid compromising operations and protrusion beyond the front wheels. A number of fixing brackets can be used to customise the position of the units.
- Mechanically fixed or using industrial double-sided tape, BOLO can be retrofitted to most small to medium forklifts.
- The state-of-the-art clutch design enables the mirrors to be set and locked. If the mirror is knocked or moved, it can be easily returned to the pre-set memory position. The mirrors are not made of glass.
- Made from sturdy materials, stainless steel and ABS plastic, BOLO is able to operate in a range of environments and temperature conditions.
